
LOINC CODES CURRENTLY ACCEPTED BY THE LOUISIANA OFFICE OF PUBLIC HEALTH

A Quick Guide

Rashad Arcement

INTRODUCTION

Logical Observation Identifiers Names and Codes (LOINC), developed and maintained by the Regenstrief Institute (Indiana University), is a database and universal standard for identifying medical laboratory observations. It was created in response to a growing demand for a universally accepted electronic database and code system that allows departments across the world to receive and send laboratory results and other clinical observations.

LOINC is commonly used by several messaging standards, including HL7 Version 2.5.1 messaging, to transfer result from different reporting systems to the appropriate healthcare networks. In 1999, it was identified by the HL7 Standards Development Organization as a preferred code set for laboratory test names in transactions between health care facilities, laboratories, laboratory testing devices, and public health authorities. LOINC is one of the standards used in U.S. Federal Government systems for the electronic exchange of clinical health information. It has also been endorsed by the American Clinical Laboratory Association (ACLA) and the College of American Pathologists (CAP).

FUNCTION

The LOINC laboratory terms set provides a standard set of universal names and codes for identifying individual laboratory and clinical results. LOINC codes allow users to merge clinical results from many sources into one database for patient care, clinical research, or management. While each LOINC is unique, the codes were not designed, nor intended, to be unique by testing location. For example, a lab may use the same methodology as a reference lab. If so, both results would use the same LOINC.

FORMAT

Each record in the LOINC database identifies a clinical observation and contains a formal 6-part name made up of a unique name for tests, identifying code with check digit, synonyms, and other useful information. Each database record includes six fields for the unique specification of each identified single test, observation, or measurement:

1. Component- what is measured, evaluated, or observed (example: urea)
2. Kind of property- characteristics of what is measured, such as length, mass, volume, time stamp and so on
3. Time aspect- interval of time over which the observation or measurement was made
4. System- context or specimen type within which the observation was made (example: blood, urine)
5. Type of scale- the scale of measure. The scale may be quantitative, ordinal, nominal or narrative
6. Type of method- procedure used to make the measurement or observation

LOINC records apply to all tests with equivalent clinical results. They are not unique per company. Additionally, distinct LOINC codes are required for each specimen for which a test kit has been calibrated. If an instrument/kit can be used on two specimens (e.g. whole blood and CSF) two LOINC codes are needed, one for whole blood and one for CSF. If two or more results per specimen are

reported (e.g., a control value or a total and a percent), two or more LOINC codes are needed per supported specimen.

ACHIEVING MEANINGFUL USE

The HITECH Act provisions of the ARRA Legislation will reward hospitals and physician practices for implementing a certified electronic health record (EHR) and establishing related technology provided they are able to demonstrate the use of healthcare information technology (HIT). The Office of the National Coordinator for Health Information Technology (ONC) has defined the standards, implementation guides, and certification criteria to be used for certification. Test procedures to evaluate conformance of EHR technology to ONC's requirements are defined by the National Institute of Standards and Technology (NIST), including the NIST test procedure for §170.302 (h) Incorporate Laboratory Test Results, which contains the following test data elements:

- Test Result
- Test Report Date
- Test Type
- LOINC Code
- Test Name (and Normal Range)
- Test Result Value
- Test Result Unit of Measure
- Test Specimen Source
- Condition/Disposition of Specimen

EHR vendors need to receive LOINC if they want to be certified. Currently, for Stage 1, labs and hospitals need to demonstrate they can receive the code. Stage 2 and 3 for meaningful use will focus more on interoperability, so more and more vendors will be requiring the codes from the LIS.

IDENTIFYING PROPER LOINC CODES

The list of LOINC codes included within this document are currently being used by various healthcare systems, hospitals, and reference labs that electronically communicate lab results to the state of Louisiana Office of Public Health. In no way is this list exhaustive or indicative of how extensive LOINC coding will be for any particular laboratory or facility. **The amount of coding required for a laboratory or facility to be compliant with the laws set forth by the Louisiana Sanitary Code for reporting reportable conditions is strictly dependent on the number of tests, types of tests, and the specifications of each test performed by a laboratory or facility wishing to report.** This document may be helpful but should not replace in house steps toward LOINC mapping done by each lab. There is too much diversity between respective test menu dictionaries for one list to be complete or applicable to all situations. However, there are resources available to help the mapping process. RELMA® is an online research tool approved by the LOINC organization. It is available at www.search.loinc.org. Additionally, here are some helpful resources:

- A list of the [Long Common Names](#)
- The [LOINC Manual](#)

Currently used LOINC codes
